Hello Thomas,

I have 3 different domains with default configuration and also with high security configuration for the DC's. But on NONE of them is local system added to the "Create a token object" user right. It is used only with service accounts for special software, in our case for BackupExec.

Best regards

Meinolf Weber

** HELP us help YOU!!! http://www.blakjak.demon.co.uk/mul_crss.htm

Every five minutes, I am receiving the following in the even
Application

event log on my domain controllers:

Security policies were propagated with warning. 0x534 : No mapping
between

account names and security IDs was done.

I've seen plenty of suggestion on how to fix this, however my situation appears unique. RSoP states that the problem is with the Domain Controller Security Policy. Specifically, under Security Settings\Local Policies\User Rights Assignment\Create a token object. The default setting is to grant Local System permission to create token objects, which is how I have it, but for some reason, I'm getting the above error about the Local System account.

I've been working with group policies lately, but I didn't think that I had tinkered with anything that would affect this.

All of the posted solutions for this problem are for other group policies and users, not an account like Local System. I haven't figured out fix this, but I need to get rid of this error and fix the problem. Please help.
