Hi,

I'm having trouble figuring out how to use Microsoft Ultrasound and Sonar to do health checks on my AD environment and for troubleshooting. Does anyone have any good links to good documentation? Thanks.

I've not used Sonar I'm afraid.

There isn't really much by way of Ultrasound documentation around other than the included help file. The help file goes into detail on various aspects of FRS and Ultrasound, but admittedly isn't really structured for anyone new to the software:(

A document which you should definitely read is the Ultrasound FAQ at:

<http://www.microsoft.com/windowsserver2003/techinfo/overview/ultrasoundfaq.aspx>

To get any real benefit out of Ultrasound you really need some familiarity with FRS.

A good starting document is "How FRS works" at

<http://technet2.microsoft.com/WindowsServer/en/library/7636aede-a944-4765-8973-40dc1e1f2d561033.aspx?mfr=>

A newsgroup more suited for Ultrasound and FRS specific queries is Microsoft.public.windows.server.dfs_frs.

If you have any specific queries on Ultrasound I'd be happy to help out if I can. I've used it in my environment for about 18 months now. It does have some bugs and the odd shortcoming, and is rather in need of a overhaul by MSFT... hint hint :)
