When you move objects from one domain to another, there is a bread crumb trail that helps keep the old permissions still valid, this is accomplished through sidHistory. To remove the old permissions (Which you won't easily see) you need to use a vbScript that Microsoft has posted.

<http://support.microsoft.com/default.aspx?scid=kb:en-us:295758>

Be careful you may not realize how much you are actually using the migrated security. I would do this to one user or group and see the effects before doing a wholesale removal. You may be surprised how much security is dependent upon this. So you understand any machines you brought across may have files and folders that need to be re-acl'd and the only way users are gain access currently is through sidHistory.

How do I remove them?

I assumed, possible erroneously that a computer which has been migrated using ADMT to a new domain would only receive policy from the new domain.

I'm finding that some users in the new domain are getting domain policy settings from the old domain.

There are also for lack of a better word "ghost profiles" on each PC.

This isn't earth shattering as the domain is up and running, it bothers me

Re: Policy from old domain applying to computers in new domain...

Re: Policy from old domain applying to computers in new domain...

because policy being applied from a domain I plan on turning off in the future bothers me.

Besides, the policies remain even after removing the computer from the new domain and adding it back again.

Any help would be appreciated.
