Hi all-

I'm working (recently hired) in a small school district (3 schools) where each school has a server. I would like all users, particularly administration, to be able to have all documents automatically saved to the server. For example, when the school secretary creates the school calendar and saves to 'My Documents', it's actually saving to a folder created on the server. Currently, those who are saving to the server, have to navigate to get there and as a result, most are saving locally. The ideal would be to have the document saved in both locations at the same time :->)

Is this possible?

Thanks!  
Mark

1. Take the ADU&C and give a homedir to every user (check the creation!)
2. Take the organizational unit, where the users resides.
3. Open properties – group policy
4. Build a new policy
5. Edit this policy
6. Go to: User Configuration – Windows Settings – Folder Redirection – My Documents (Properties)
7. Select: Setting – Basic and Target folder location: Redirect to the user's home directory

Re: saving documents directly to server?

If you do so, all 'My Document'-folders are re-directed to the server-homes!

Good luck.

Peter

If you're using ms-office, you can also re-direct the standard-path for documents and templates via Group Policy. You just have to download the adm-templates for ms-office (office ressource kit), put the adm-file(s) to the windows\inf folder and link the new templates via context menu to the gp-editor.

So the users don't have to decide!

Peter
