Hi Meinolf,

Yes, I can see the SID.
Here's what I can see in the Members tab, and in the ForeignSecurityPrincipals container :
[SID]CNF:[GUID]

Thanks,
Dominic

Hello Dominic,

Can you see the SID in the administrators group which you are using with restricted groups?

Best regards

Meinolf Weber

Hi,

We have a problem with our A.D.
We have 9 DC in 8 different sites. All DC are W2K3 Std R2 SP2 with all hotfixes.
Domain functional level is Windows Server 2003.
We have a GPO that use Restricted Groups to set members of the Built-In Administrators group. We have an event in Application Event

Re: Problem deleting an unknown object in a group

Log on all DC. SceCLI event #1202 : "Security policies were propagated with warning. 0x4b8 : An extended error has occurred."

I've enabled debug logging for the Security Configuration client-side extension and I have found this error in Winlogon.log :
remove SID: S-1-5-21-1047738115-132384186-1539857752-500.
Error 1377: The specified account name is not a member of the local group.
error removing SID: S-1-5-21-1047738115-132384186-1539857752-500.
This SID is an object from a trusted domain. The trust has been deleted and we forgot to remove it from the GPO before deleting the trust.

When I go directly to the Administrators group and I try to delete the member manually, I receive this warning after clicking on Apply :
The object is no longer a member of this group. It may still appear due to standard delays in replication between domain controllers.
I've done this yesterday and I have this message again this morning, so I know it is not a replication delay.

In the ForeignSecurityPrincipals container, I can see the object. Can I delete the object directly in this place ? Will this result in removing the object from the Administrators group ? Can this cause other issue ? If yes, what should I do to remove the object from the Administrators group ?

Thank you very much,
Dominic
