Log: Security  
 Source: Microsoft Windows security auditing.  
 ID: 4675

The description says that a SID has been filtered, even though SID filtering is deactivated on the trust relationship.

Thanks!

Jeff Courteau

The security log on the 2008 file server. However, if the file server is a  
Windows server 2003 member of my 2008 domain, there is no problem at  
all...

Thanks!

which security log? (which DC?, 2003 or 2008?)

Hi there,

We just created a forest trust relationship between an AD2003 domain and an AD2008 domain. We are experiencing a really wierd issue. Here it is:

A user from the 2003 domain needs to have a permission to access a shared folder on a member server of the 2008 domain. If we put the 2003 domain user in a 2008 local domain group and then give the permission to this group to access the folder on the 2008 member server, it fails. The security log says that a SID has been filtered.

If we explicitly give the permission to the same user on the same folder, it is successful.

If we put the 2003 user in a 2003 domain universal group, then put that universal group in the 2008 local domain group then give permission to the local domain group on the 2008 file server, it still fails, and gives the same security event.

If we promote our 2008 file server as a DC, it starts to work. If we demote it back as a file server, it continues to work.

– I compared ALL the local and domain policies, and everything seems fine.

## Re: Filtered Sid

- I made sure that SID filtering is disabled on the trust relationship (anyway, it shouldn't be a concern, since it is a forest trust)
- I made sure SID History is enabled on the trust relationship (but this too shouldn't be a concern since the user has not been migrated)

What could I do next to troubleshoot this issue?
