We have a 5 user Server 2003 network with Birch Telecom providing the DHCP. The current configuration is with XP PRO workstations that pull their DNS settings from the Birch Telecom network interface.

We are having an Autoenrollement error 15. If I point the DNS to the Server's DNS, I cannot even login. If I let the automatic DNS settings from the Birch Telecom network interface apply, I can login but it is SLOW.

Someone suggested that we need two NICS, 1 for the internet and 1 for the internal network. I looked through best practices but found no mention of this.

How can I clear up the error and speed up the login process?

.
