Hello all,

Here is the problem I am having. I have a domain with 2 – 2003 domain controllers and a number of XP and 2000 workstations. I have a GPO that I need to have applied to some lab computers, most of which are 2000. I have a request that all of those computers not have Internet access.

Problem I am having is that when the policy applies, I get the proxy applied but cannot get to local and exempted websites. Tempermental it is, because it also will not take away the connection page like I have told it to.

- I have created an OU and put the computers into it and applied the GPO to the OU.
- I have created a security group and put the computers into the group and put the group into the security filtering under the Scope tab of the GPO.
- I have tried to put just the GPO with Authenticated users into the Scope and apply it to the OU that the computers are in.

I am not sure what else I can do to get this to work. I have included the GPO settings so that way you can tell me if I have included something I shouldn't have or need to put something in there I haven't.

I have created an OU to test this on and will apply it to production OUs once I have confirmed it works right.

Policy Setting

Group Policy refresh interval for computers Enabled

This setting allows you to customize how often Group Policy is
applied

to computers. The range is 0 to 64800 minutes (45 days).

Minutes: 0

This is a random time added to the refresh interval to prevent
all clients from requesting Group Policy at the same time.

The range is 0 to 1440 minutes (24 hours)

Minutes: 0
