I have an existing 2000 mixed mode domain just added a 2003 server into the mix and promoted it to DC. The AD transfer happened but I am not sure everything is operating correctly. I am under the impression that as it stands at this point that my AD (along with my AD integrated DNS) should be replicating between these two DC's ?? If so it appears to NOT be happening. How can I verify this ? I did create a dummy user ( me hehehe ) in the AD on the new DC..... but haven't observed the new user over in my 2000 server AD.

Not sure if I am under the correct assumptions that I should see these changes reflected between the two in a very quick fashion? For that matter before I decommission the old existing w2k DC I should see the AD correctly replicating between the two ?

thanks

.
