As I told you before, you should det the value to "0". The question is if it's being applied correctly. To the error check this one for similar behaviors:

<http://www.eventid.net/display.asp?eventid=1090&eventno=1881&source=Userenv&phase=1>

I am setting these sttings on the windows 2003 server which is my only domain controller.

When I run rsop.msc on a local machine, it says "RSOP data is invalid. likely cause....." and then by details it says: "Invalid namespace".

Thanks

"Jorge Silva" wrote:

When you run rsop.msc what value is defined? Where are you applying these values? PW policies must be applied at domain level, is tgis what you're doing?
