I have run into a wall with this one. Here's the setup:

- Windows Server 2003 Cluster (2 nodes)
- Logon Locally restricted to local Administrators only
- Global group used to nest membership of Local Administrators group at the domain level
- AD user account is a member of global group with admin access locally

When the user account is a granted access via the global group membership logon locally is denied by the local policy. If the user account is explicitly made a member of local Administrators group logon locally is permitted. Test accounts have been created and do not have the same issue.

Any help is greatly appreciated!
