Sounds like something has a handle to the drive that is preventing cluster from completing the Offline process. What kind of group is this disk resource in?

Hi,

I have a 2 node cluster that works correctly when the active server goes down. All resources are taken over by the passive member.

When I try to move resources from node 1 to node 2 everything works fine as well.

The problem is that when I try to move the the resources back to the original node all resources move except for one physical disk. This physical disk status remains as "offline pending". The cluster log contains many entries similar to what follows:

"FmpofflineResource: offline resource <drivex>returned pending"
until finally

"RmpTimerThread: Resource drivex pending timed out, CP 3 – seting state to failed."

The only way for us to get the offline resource available for the other cluster member is to reboot the server that failed to put the physical drive offline.

Any ideas would be appreciated.

Thanks in Advance,

Henry
