Dear All,

I am installing a server cluster. The cluster network name is failing to come online with the following error.

Cluster resource 'Cluster Name' failed to go online because its associated computer account (INGBTCPIC5XX093) exists in Active Directory and the Kerberos authentication is not enabled for the resource. Client applications that are using Kerberos based authentication (either directly or through the Negotiate security package) will fail to authenticate when contacting a service by this network name.

To bring the resource online, either enable Kerberos authentication or delete the computer account.

Any help to resolve the issue will be highly appreciated.

Regards
Balaji
