I duplicated the partitions in Virtual Server and as Jeff indicated only the physical drives are presented and controlled by the cluster. Both partitions are available on the active nodes, and will fail over together. Not sure I'd use this approach for a production server however, I think I'd present a second physical drive.

- 1) No, you didn't miss anything, Node1 is the active node and has the resources in it.
- 2) It sounds like you only have 1 disk presented to the cluster with 2 partitions, on Node 1 can you see the partition? If not go into Computer Management and then Disk Management and see if you see the 2nd partition. If you see it there, you may need to initialize it and format and assign a drive letter. I've never tried to set one up like this and to be honest not sure what will happen once you get it initialized. Gonna go play with this in Virtual Server and see what happens.

Here's a link to setting up a clustered print server

Hello.

Just created a two node cluster. This is purposed for file and print services. Everything is online and working. I have one GROUP called the CLUSTER GROUP and it all looks healthy.

A couple of questions...

- 1) NODE1 has three folders ACTIVE GROUPS, ACTIVE RESOURCES, and NETWORK INTERFACES. NODE2 has the same thing but NODE1 has records in each

Re: Adding Virtual Print Server Resource No Physical Disk Appears Drop

of
the
two folders, but NODE2 does not. DID I MISS SOMETHING?

2) In trying to set up a Virtual Print Server, I go through all of the steps but when it is time to create the PHYSICAL DISK resource...on the DISK PARAMETERS screen--nothing appears in the drop down for the DISK.
