Not sure if this is a problem, but it is somewhat irritating. I have both windows and unix hosts on my network. I have server 2003 for dns with dynamic update enabled. I have dynamically created host entries in dns for my windows clients and static entries for my unix clients.

I have two zones:

company.com, which has static entries and..
corp.company.com which has dynamic entries...

The issue is that i need to enter the FQDN for my unix hosts to resolve them. I can resolve windows systems using only the hostname. I would like to be able to resolve everything using only the hostname.
