> Thanks for giving me a clue!

This sounds like a classic DNS misconfiguration. If you can provide the following info, we'll be able to pinpoint it with 98% accuracy, considering there is nothing out of the ordinary added, such as Zone Alarm, (and other applications) etc, which can cause major issues.

1. Unedited ipconfig /all from a client and from your DC(s)
2. The actual DNS domain name of AD (found in ADUC)
3. The zonename spelling in your Forward Lookup Zones in DNS for your AD zone
4. If updates are set to allow under the zone's properties
5. If any of the DCs have more than one NIC
6. Do you have a firewall? If so, what brand?
7. Is/are forwarder(s) configured?
8. Do the SRV records exist under your zone name?

Thank you,

--
