I looked at the link that you posted. It seems very complicated for something simple I am trying to accomplish. I tried a few of the steps and could not get it to work properly. Let me clarify what I am trying to do.

My ISP forwards the reverse lookup zone (ie. 192.168.1.1/24) to my name server which is Win2003. All I am trying to do is set my name server to forward any requests that come to my name server for 192.168.1.1/24 to forward to another name server (ie. ns1.domain.com) to get the reverse dns lookup info.

Any help on this would be appreciated. I can't see it being that complicated that I need to set up 255 individual records to point each individual IP address to the other name server. There should be a way to set this up that any requests that come in to our name server for 192.168.1.1/24 will forward that request to another name server for resolution.

Thanks.
