We have three Windows 2003 domain controllers, all running DNS for our entire network. One of these servers cannot successfully preform NSLOOKUP on external sites, but it works for internal sites. Even setting the server to another external public DNS server fails. I see the DNS queries going through my firewall to all the root hint servers, but nothing ever resolves. I have two more servers where this works just fine. All three servers are setup identical.

Has anyone seen this before?

.
