We have a point to point T1 connecting 2 sites. Site 1 has the authentication server which is also the DNS/DHCP server.

Site 2 computers can ping across the T1 connection to the server, and can get out to the internet if i use an external DNS server, but i cannot get the Site 2 computers to login to the server, or use the server as their DNS server.

I believe it is something to do with the DNS setup, but i am not sure.

Any help?

Thanks!
