But I do not control the existing DNS zones, they are public zones hosted by an external hosting company. Imagine wanting to have a private test.yahoo.com website! Also, my company policy will not allow me to publish internal IP addresses out in public (silly I know).

Even in that case you go to the parent and DELEGATE, then

setup the test.mycompany.com on the delegated DNS server <<

So are you suggest we have the external hosting company add a delegation to a new subzone like blah.mycompany.com pointing at a publicly unreachable but internally reachable DNS server on our internal IP, and there put the entries like test.blah.mycompany.com? The catch with this is that I still end up publishing an internal IP publically, so thats no good.

I believe this has to be an internal solution. I can do it today with lots of self referencing zones, but as I said, this is a management nightmare. I am looking for a better alternative:)

Al
