Hello.

I have one question about Active Directory integrated DNS zone.

My organization want to use dns domain in their browser without www in front. We have the following configuration.

2 external dns servers, where this is OK.

2 internal dns servers that also is Active Directory servers.

The DNS Zone is active directory integrated.

I can see that there is 2 records – (same as parent folder) pointing to our AD servers.

What are these 2 records used for, and can it be deleted ??

These are the LDAP IP Address records and they cannot be deleted, they also resolve the SYSVOL and NETLOGON DFS logon shares \\ADDNSDomain\SYSVOL and \\ADDNSDomain\NETLOGON where logon scripts and GPOs are found by domain members.

If you want to make your website available by <http://ADDNSDomain> create web sites on all Domain controllers using the host header 'websitedomain' (without the quotes) pointing the website to an empty folder, after you create the website, go to that sites properties sheet in Internet Services manager, Home Directory tab, select "A redirection to a URL" and enter <http://www.ADDNSDomain>

Then all you need is the www record in DNS that resolves the website IP address.

Is it possible for me to add a new DNS record in the AD integrated zone (same as parent folder) pointing to my web server ?

No, this could direct member clients to the Web server for group policies and logon scripts and cause 1000 events in the log.
