Hi All,

Should I allow clients to resolve internet addresses by setting up forwarding on my DNS servers. All my DNS servers are DCs in Windows 2003 native domain.

I was going to just force all internet lookups to go via IE and proxy server.

What are the security implications of allowing this. I read somewhere that the DNS packet will contain information about the ip address structure and naming of our domain. Is this true? Does it matter?

TIA

James Tulloch
