thats good information...but i dont know how to post to multiple groups at once..and my orig post ..which you gave one answer....thank you for that...but was not exactly what i was looking for...

in my case at the moment is my email server (box and software) is in local office not at isp....
and im having problems seeing the email server from outside the local office.....

hope that makes more sense
MJ
again thank you for your help

Mike,
When you post you can add more groups to the list you post to, rather than post separate messages to different groups. It keeps the replies together and saves people responding to questions already answered. It doesn't stop other people answering, though.
Anthony

sure i will...but also its a dns issue also when setting up
resolving to other servers
thanks for you help so much
MJ

i have a mail server here at my office....
and i want to send and recieve mail through
our public web site.....
how to get this working since my mail server
is at the local office and
not
at the hosting site

do i create mail exchange records pointing to
my local office....
what are the steps...
example:
site is IHAVENOCCLUE.COM.COM
69.123.124.125 some ip

mail server is at my local office
126.223,224,225 public/gateway (example)

i want to send and recieve email through the
above site

MJ
