In addition, the problem with the reverse zone is that the laptops are probably registering themselves, and in that case the DHCP server cannot remove the PTR because it doesn't have permission to remove records it did not create. I've found the best solution is to disable DDNS on the client and force DHCP to register for the laptops. In ADUC create a new OU for the DHCP Clients and create a new GPO that disables DDNS on the DHCP clients. Make sure you then have DHCP set to update clients that do not request updates.

Hope This Helps

Kevin,

Please can I ask you to clarify your position on the comment above as I am having a similar problem. Most of the recommendations I read seem to suggest letting the client handle the DNS registration and turn off the ability for DHCP to update DNS.

Look forward to your thoughts.

Regards

Jimmy
