I am running Microsoft DNS on my outside interface. We have www.irvingisd.net working just fine. We recently fixed Registry.com so we can control irvingisd.COM and irvingisd.ORG in house.

1. How do I get www.irvingisd.COM/ORG to point to our webpage at www.irvingisd.net?

Create A records named www that give the IP address of the www.irvingisd.net website. If it is using host headers, you will need to add the host headers to the website too. Alternately, you can add CNAME records named www, that give www.irvingisd.net as the FQDN, but you still will have to add host headers if the site uses them.

2. How do I get irvingisd.net (without the www) to point to our webpage?

Add a new host, leave the name field blank, and give it the IP of the website.

NOTE–If this is an Active Directory domain and irvingisd.net is your AD

Re: DNS Help

domain name, you cannot access the website by the domain name and do not add a record for the website. There is one workararound that allows you to use the domain name only, but it requires you to create a website on all DCs that redirects to <http://www.irvingisd.net> Active Directory domains are required to resolve to IP addresses of Domain Controllers only, to allow access to the DFS shares located on the DCs by domain name, ex. \\irvingisd.net\SYSVOL & \\irvingisd.net\NETLOGON
