I don't know where to start to troubleshooting from here. But once it does get an ip address the network speed is up to par.

In addition to Meinholf's wise reply, note that SBS does a lot of things its own way (it has wizards for most things, and if you're wise you'll use them even if you know how to do the stuff manually). There's a wizard to change the IP address, which you should use. Try posting future SBS questions in microsoft.public.windows.server.sbs.
