I think I have a quite common problem but cannot seem to fix this...

I run a 2k3 server with DNS, DHCP and AD.
I have 4 client computers who contact this server directly.

The server has 2 NIC's, one for the internal network, set on 192.168.0.1
The other nic is automatic and goes to my ISP.
the second nic has ICS enabled.

at start this works quite good but after a few hours the internet connection is lost throughout the whole network (including the server) and the server cannot be contacted from an external connection.
All internal connections work fine.

Also when running IPconfig on the server everything seems to be fine but no internet.

I have read about conflicts between ICS and DNS servers but I need my DNS server for GPO's.
It has worked perfectly fine before but since I installed the new server this problem keeps getting back and I can't seem to find the problem.

I hope this is a common problem and maybe someone can answer this quite easily.
I'm not that good with this kind of configurations...

Many thanks

.
