I asked this a while ago and didn't get a response.

Just thought I'd give it one more try for those of you who may not have read the post but may know the answer.

Does anyone know of any software (freeware or commercial) that will allow me to audit my 2k servers. By audit, I mean log file access (to a specified set of files), who accessed it, when they accessed it etc. That kind of stuff.

Now before anyone says it, I know 2k server will do auditing, but from experience the entries it creates in the event log are horrendous to make sense of as it makes about 20 entries per file access – creating huge unmanageable logs.

Thanks
