I receive the following alert when I try to add users and groups to acl's (in this case a NTFS permissions on a folder). "The advanced page cannot be opened because of following error: The system detected a possible attempt to compromise security. Please ensure that you can contact the server that authenticated you." The server is a Windows 2003 Server and is a member of a Windows 2003 domain. This event only appears to happen when logged into the server as the domain Administrator. I have logged in as another user with the same rights and am able to add users to acl's.

What is wrong with the Administrator account?
