Hello

I am having problems when connecting to a domain on a Win2k3 server with an XP computer. The computer does connect to the domain, but the logon script never runs, thus no drives are mapped. I need to click Start -> Log Off and login again to get the logon script to run. This is very consistent. It works this way, regardless of the user account I am logging in with. All other workstations on the domain are working fine, even with the same user accounts I am having trouble with on the original computer. The problem seems to be with the computer itself. I reformatted the hard drive and reconfigured everything from scratch, but that didn't help.

Event Viewer shows the following warning in the System log:

Your computer was not able to renew its address from the network (from the DHCP server) for the Network Card with address 000CF1AAA9B0. The following error occurred: The Semaphore timeout period has expired. Your computer will continue to try and obtain an address on its own from the network address (DHCP) server.

An ipconfig does show an IP address, and as stated earlier, I am connected to the domain, but the logon script does not run.

The computer is a new Dell Dimension, running Windows XP Professional with an Intel Pro/100 VE nic card. Any ideas?

Thanks
