Our company webserver is running on Windows Server 2003 with connection to the ISP through a Linux box. Users go out onto the Internet through this server also. Recently management has observed that a lot of network bandwidth is expended on web surfing by users during office hours and therefore it has been decided to implement a control policy limiting user access to the Internet during particular hours (break time and after hours). How do one implement this? Can this be achieved on the Win2003 server as the ISP is not cooperative enough to do something on the Linux box? Any help is appreciated.
Thanks
