Hi,

When are you not getting the option to repair? You should boot the CD and start the installer. Hit F8 to get past the license screen, then it should detect and offer to repair an existing installation. If not, then the volume holding the existing installation is likely corrupt, and you will end up formatting – repair will not be an option. An alternate fix would be to install to another partition, then recover the user data from the old installation.

Hello!!

I have moved my HardDisk to another more faster PC, but the OS (windows xp home) does not start!!!!

I have tried to reinstall by booting the Windows XP CD and selecting the "Repair option" .... but that option does not appear!!!! ..... it only shows the partitions available to Perform a Clean Install .....

Help me please!!!
