Hello Dave,

I don't understand exactly what you mean. When I try to reach the administrative share I get a logon-screen because I've got no rights on the share, but then I logon with the domain-admin credentials and this secondary logon seems not to work?

It's o.k. for me to have not direct rights via my actually logged on credentials, but the secondary logon doesn't work.

Do I misunderstand something?

Thanks Alfred
