This may be the issue:

Down level client compatibility – To prevent domain controllers from requiring secure channel signing or encryption Open Active Directory Users and Computers. In the console tree, right-click Domain Controllers, click Properties, and then click the Group Policy tab. Click Default Domain Controllers Policy, and then click Edit. Under Security Options, right-click Domain member: Digitally encrypt or sign secure channel data (always), click Properties, and then click Disabled. Where?

- \* Computer Configuration
- \* Windows Settings
- \* Security Settings
- \* Local Policies
- \* Security Options

By disabling this security setting, you expose secure channel communications to man-in-the-middle attacks.
