Hi All,

I'm having a little trouble setting up NTFS permissions within a Share.

Share X contains several folders A to Z, folders A – Z contain several folders themselves A – C.

Share X has read write permissions for my user group and full control for admins. (share permissions) NTFS permissions are set to full for admin, read for my user group and full for Creator Owner. No inheritable permissions are set.

Folders A – Z contain the same NTFS permissions as the share. In addition special permission for my usergroup is modify for subfolders and files only.

Now whatever permissions i set on folders A – C within for example Folder A is giving me headaches. Because i dont want A – E to be deleted or Modified, changes within this directory can be made by everyone in the allowed usergroup, but not the folders themselves, next problem, if i delete a folder on the highest level, it says it cannot delete folders A and A – C and thats what i want, but when i check all the files in the subfolders A – C are deleted, I dont want that!!

So: Share X

Folder A

Subfolder A

Subfolder B

Subfolder C

If i delete Folder A al the files and subfolders within subfolder A, B and C are deleted, how can i prevent this without restricting my users modify rigthts within these folders?

Any help appreciated,

Werner
