I am not sure what is happening to you, but I have a similar problem. I am running Windows 2003 server and have Windows XP as clients. I setup a roaming profile, and it worked with the exception of the background for the profile. It does not load when you sign on to another computer. When you go to display properties, the correct background is listed, and if you click ok it will then be displayed as the background, but it doesn't happen automatically as it should. Anyone know a solution?
