Hi,

Although only an annoyance, when users print on my network I get an error event ID 560 in the Security log. I audit for print success/Failure and failure to delete print jobs using the 'everyone' group. Can someone shed some light on this and what I can do to get rid of these events. The users all are allowed to print to these printers, and I get the usual print event in the system log.

As a second one with printing, I usually get anonymous users in the print events especially when they print MS Project data, why, and how can I get the real username instead of Anonymous in the log.

We're running NT4 sp6a + post 6a Security hotfix on all machines.

Regards

Jonathan
