We have a 100 machines LAN with all clients running XP and Active Directory running on a 2003 server. This DC is also running DNS and WINS and is a DHCP server. We have created an OU called Students and have created a standard student group policy associated to this OU it has been working fine but now some User accounts with load it and other wont. So client machines with load it and other wont.

We are getting the errors 1030 and 1058 userenv in the event viewer on the client machines, we have looked on KB and the articles have not fixed the problem.

Thanks in advance
