First you need to enable auditing on the machine. You can do this through Local Security Policy or Group Policy. Administrative Tools/Local Security Policy – expand Local Policies, click on Audit Policy, and in the right pane double click on Audit object access – select Success and Failure.

Second, enable auditing on the desired folder. Open Windows Explorer, right click on the folder and select Properties. Click the Security tab, click the Advanced button, and click the Auditing tab. Click the Add button and add the users/groups you want to audit. Results appear in Event Viewer/Security on the local machine.
