Hi,

I encountered a problem with the Task scheduler with Windows 2003 standart edition.

I'll want to make a scheduled task that launch a .bat file. The .bat file works great (tested in command prompt).

I assign my save user to do this task. When I have an interactive session opened with my save user, and then I launch the task manually, it work. But if I close my session, the task does not launch, and I found this error in the log :

```
"backup.job" (backup.bat) **ERROR**  
0x80070005: Access is denied.
```

Try using the Task page Browse button to locate application.

My save user have full ntfs permission on both .bat and .job directory.

Please need help :)

PS/ sorry for my poor English :p
