Administrators, System, username: Full Control

For c:\Documents and Settings the permissions are:
Administrators, System: Full Control
Users, Everyone: Read&Exec, List Folder, Read

Re: user profile problem

>

No share points to c:\Documents and Settings\username

On the server there are 2 disks, C: and D:

D: is used to store users home dir and data files with relative shares

C: is used only for operating system and all the share are administrative or domain related, like c\$, admin\$, netlogon, print\$.
