RIS server 2K SP4

I have a couple of dozen PCs with the above NIC which comes embedded in the motherboard.

Machines boots and starts installing the OS. When it gets to the Starting Windows 2000 (text mode) I get a "blue screen of death". If I use a 3com NIC supported by RIS it works OK.

I have the drivers for the Intel on the %oem%\\$1\$\Drivers folder and it even installs the drivers on the GUI part of the installation.

This happens on pretty much all PCs using the Intel(R) Pro/100 NIC

Anyone else having problems with it?

Thanks in advance.

.
