Thanks for replying. I could set the student computers to a static IP. That would be about 80 computers. And i could fix the cable modem for their gateway. Then i have the staff computers on the DSL. When the students use a staff computer they would be going out on the DSL but that is not a problem. Even if i could put both internet connections on the same ISA box i could still fix the IP on student machines. And i could isolate them by room number because i only have two classrooms with more than ten student workstations... Hmmmmm. You give me good thoughts. charlie
