Hello,

I am wondering if anyone can help me get this one drive of mine in server 2003 back to a normal basic disc. Some how it has turned into a GPT protected partiton and I have never seen this before. All the conventional methods have not worked.

this disk sits on an IDE RAID controller and it is all by itself It does not effect my RAID -5 set I am trying to get it back to pre install "unallocated" status

Thank you
Joe
