Unfortunately that will work by machine only. Basically you would assign the machines you want restricted to the DNS server that you setup.

However after a little digging, I think you may have been on track with your first post. By using Software Restriction policy – Additional Rules – New Internet Zone rule you can define a list of trusted sites and disallow the Internet Zone. Again this is a computer policy and not a user policy, so it is only valid by machine, not user. But it is lot less overhead than confiring the other options.
