Hi Gabe,

Thanks for the update!

I understand both of two DCs in the same subnet and there is no firewall between them, however, I am not sure how the CPQTEAM acts and if it has similiar function to block the port. This is the reason I confirm with you. I apologize for any confusion.

This issue does like a little wierd. I would like to confirm that are you able to scuessfully add win2k3 domain account to the win2k domain? In other words, if you share a folder in win2k domain, are you able to select win2k3 domain and add account to the folder Security tab? If you share a folder in win2k3 domain, are you able to select win2k domain and add account to the folder Security tab?

I ask these questions intend to know if the trust has been sucessfully establish and the only issue is you receveid the error message when validate this trust; or the trust has not been succussfully established at all.

On other hand, I will perform more resaerch on this issue and post back if I have any found.

Thank you for your patience!

Best regards,

Rebecca Chen
