Hello!! I'm the same issue, the same error, but, I have Windows 2003 AD in both sides, with SP1. In my case, I have a great production domain and I have set 2 additional domains for 2 new little areas. I set a two way external trust with the other new domain, and it can set, but i cannot validate it on any of two DC of the great production domain. I can view users of the other domain to set permissions in shared folders, but, I can't set permissions to sharepoint and Project Server (Those servers belong to the great domain)...

Last week. I set a one way external trust between the great domain and one of the new domains and it works fine! The only difference between 2 new little domains is that one DC (where trust works) doesn't have W2K3 SP1.

I didn't add any trusted domain as a secondary DNS zone, but I set DNS forwarders. All Servers are in the same subnet and I can ping all DC-names (dns and netbios name) in all sides. The great domain is compatible with pre-2000 OS, but the 2 new domains not. The primary DC of the great domain is a HP Itanium II (64 bits), the same error of Gabe appear in this DC. The other DC ask for an administrator account in order to validate the trust, but never doesn't accept the user/password that I provide (it's the correct user/password).

Please, help me, Rebeca! I couldn't image that the new trust wouldn't work, and the three domains are in production...
