I am using group policy and also profiles for our users here at the school. The Group Policy's work fine. My 2 issues are with the profiles. When I create the profiles, I use roaming profiles so that they are stored on the server and that way they user gets the same experience on any machine. The profile is working fine except for that when I change the background on the machine, and the log off and log on to machine 2 it hasn't carried over the background. Yet on machine 2 if I look at the display properties is it already has selected the background that was chosen on machine 2. If I simply hit Ok it changes the wallpaper to the correct one.

2. Is there a way so that I can have the security set the roaming profiles main folder so that as the administrator I can access and copy users profile settings while still keeping security enabled so that one user can't mess with another users profile settings or folder? I followed the Knowledge base instructions on setting up the Main Profiles folder but after that, as the admin, I can't access the users profile folders.
