yup, all shares on dc, and deligations are being assigned to domain admins, security on folders and subfolders under sysvol are all assigned to domain admins, if i go back to adding policy objects it still says access denied, and this time, if i select the two existing defaut objects it says that there is a Inconsistency between security settings on the sysvol and active directory, whether if select cancel or ok to revert it back to the settings on the active directory, it still says access denied, i checked on the active directory managment SP1 i cant find any relationship based on the prompt that was showing up
