I changed username from Administrator (local computer) to domain user and everything works just fine. There's no need to run batch file.

Not that I'm lazy. I worked on IBM 7094 II (if you know what it is) in FORTRAN and assembler and wrote the first interactive text editor in the Soviet Union. The terminals were teletypes with 50 baud. That was 30 years ago. Unfortunately we were not allowed to make millions of dollars at that time like you guys. Now we're living in completely different country. I remember also time when VAX 11/780 was the BEST computer in the world (from the programmer's point of view).

Sergey
